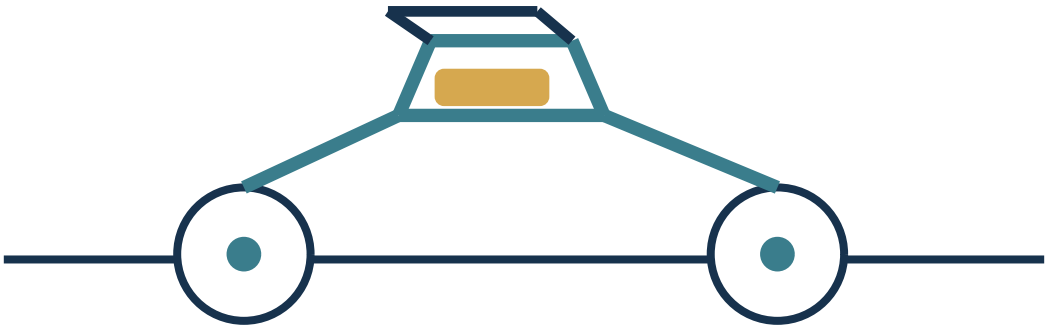
MARKET RESEARCH REPORT

INDIAN ELECTRIC TWO-WHEELER INDUSTRY

Industry Overview | Target Audience | Competitor Analysis | SWOT | Market Trends

THE SHIFT TOWARDS ELECTRIC MOBILITY



A study of the Indian electric two-wheeler market, its customers, competitors, growth drivers and strategic challenges.

INDUSTRY **Electric Vehicles (EVs)**	**GEOGRAPHY** **India**	**FOCUS** **Electric scooters and motorcycles**

Prepared as an academic market research report

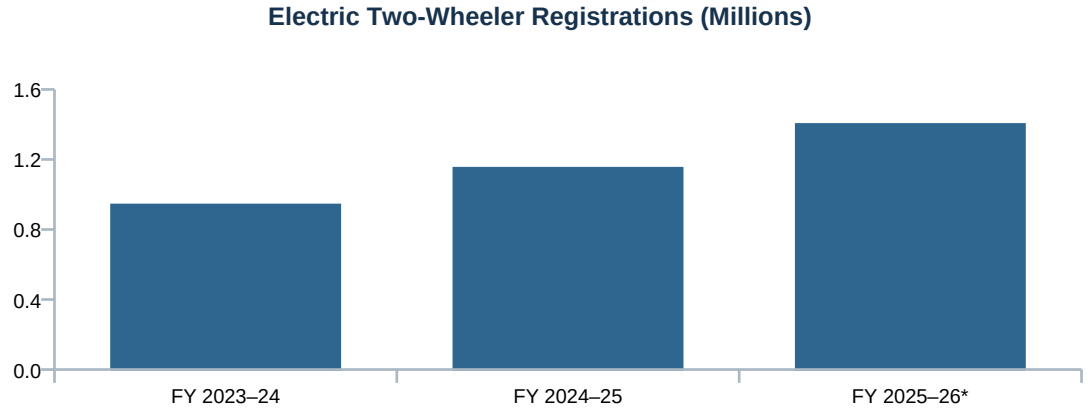
1. Introduction and Market Overview

The Indian electric two-wheeler industry is an important and rapidly developing segment of the automobile sector. It includes electric scooters and motorcycles powered by rechargeable batteries and electric motors rather than conventional petrol engines. Rising fuel expenses, environmental awareness, improvements in battery technology and government initiatives have encouraged consumers to consider electric mobility.

The market includes established automobile manufacturers as well as EV-focused companies. Competition increasingly centres on affordability, real-world range, battery reliability, charging access, design, connected features and after-sales service.

2. Market Growth

The chart shows indicative annual electric two-wheeler registrations in India. FY 2025–26 is rounded and approximate; totals can vary by source and reporting cut-off.



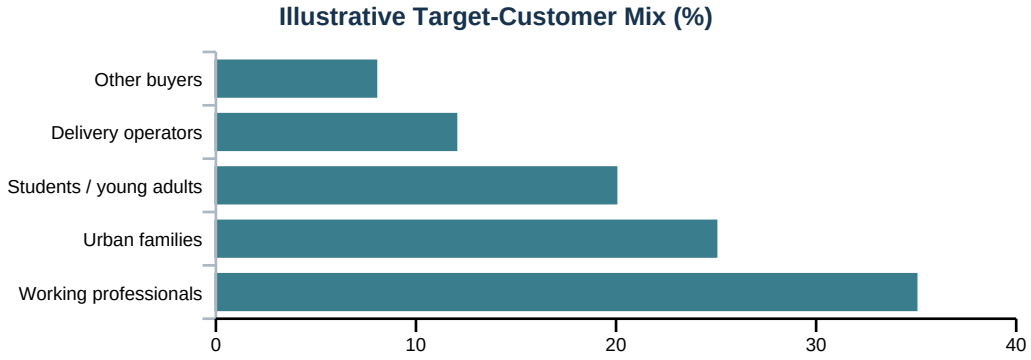
*FY 2025–26 value is approximate and rounded.

Financial year	Registrations	Market observation
FY 2023–24	0.94 million	Growing consumer interest in electric mobility
FY 2024–25	1.15 million	Wider product availability and competition
FY 2025–26*	1.40 million	Continued expansion of the market

Key observations: registrations have increased across the years shown. Established manufacturers are expanding their electric portfolios, while consumers increasingly compare operating cost, practical range, reliability and service support. The market is moving towards competition based on overall customer value.

3. Target Audience

The target audience includes individuals and businesses seeking convenient, economical two-wheeler transportation. The segments below describe likely customer groups; the chart is an illustrative segmentation for analysis, not the result of a published consumer survey.



Indicative proportions used only to visualise the relative importance of potential customer segments; not measured market shares.

3.1 Customer Needs

Segment	Main needs and preferences
Students and young adults	Affordable commuting, ease of use and practical running costs
Working professionals	Reliable daily travel, convenient charging and reduced fuel expenses
Urban and semi-urban families	Comfort, safety, dependable range and local mobility
Delivery and business operators	High vehicle utilisation, predictable operating costs and service availability
Environment-conscious / tech-oriented buyers	Lower tailpipe emissions, connected features and modern design

4. Competitor Analysis

The market includes established vehicle manufacturers and EV-focused companies. The comparison below summarises selected competitors and their broad positioning; it is qualitative rather than a ranking by market share.

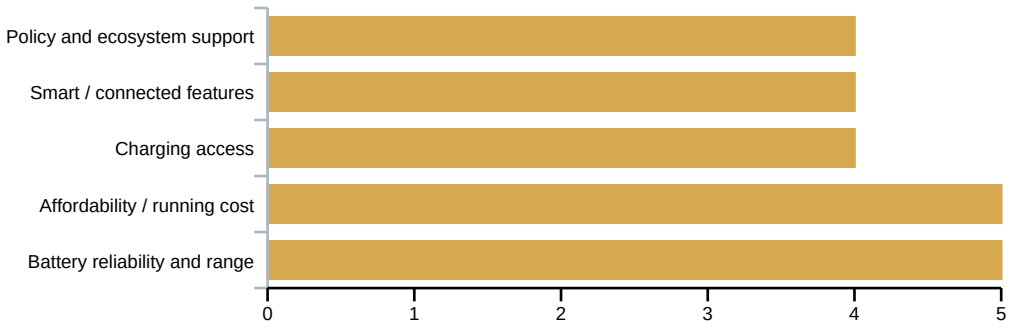
Company	Representative products	Competitive strengths
TVS Motor Company	TVS iQube	Established brand, dealership reach and service network
Bajaj Auto	Bajaj Chetak	Brand recognition, product design and distribution capability
Ather Energy	Ather 450 series, Rizta	Technology-led positioning, connected features and charging ecosystem
Ola Electric	Ola S1 range	EV-focused brand, product range and digital-first positioning
Hero MotoCorp / VIDA	VIDA electric scooters	Automotive experience and established distribution presence

Competitive position: established manufacturers can leverage brand familiarity, dealerships and service capabilities. EV-focused companies often compete through software, connected features, innovation and an electric-mobility identity. Buyers compare total cost of ownership, practical range, warranty and charging convenience.

5. Market Trends and Strategic Importance

The following chart is an analytical assessment of how strongly each trend may influence purchase decisions and industry development. Scores are qualitative (1 = lower influence; 5 = higher influence), not survey statistics.

Qualitative Influence Assessment (Scale of 1–5)



Key trends include growing EV adoption, battery technology development, connected vehicle features, charging ecosystem expansion, policy support and intensifying competition. Together, these trends make product reliability and ownership experience increasingly important.

6. Challenges Facing the Industry

Charging access: facilities are unevenly distributed, particularly outside major urban areas. **Battery economics:** batteries contribute significantly to vehicle cost, and replacement can be expensive. **Customer confidence:** buyers need clear information about real-world range, warranty, safety and service. **Supply chains:** battery production depends on critical minerals and components whose prices and availability can fluctuate. **Competitive pressure:** manufacturers must improve products while maintaining sustainable costs.

7. SWOT Analysis

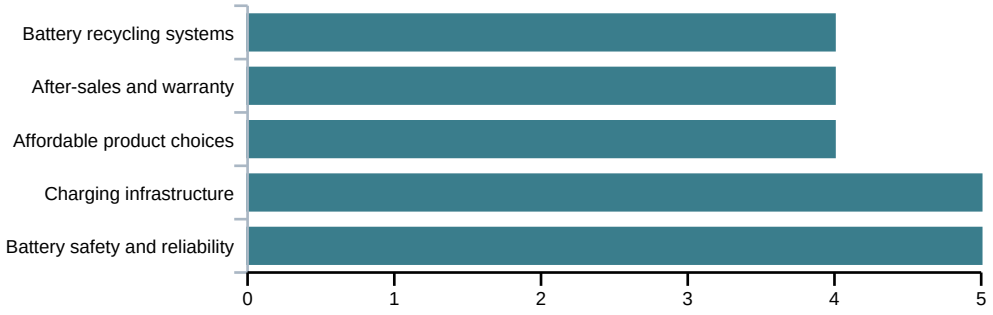
SWOT identifies internal strengths and weaknesses, together with external opportunities and threats affecting the industry.

STRENGTHS	WEAKNESSES
• Lower running costs than many petrol alternatives. • No tailpipe emissions during operation. • Growing consumer awareness. • Participation of established manufacturers. • Scope for smart and connected features.	• Higher upfront cost for some models. • Limited charging access in some locations. • Battery replacement may be expensive. • Charging generally takes longer than refuelling. • Dependence on battery supply chains.
OPPORTUNITIES	**THREATS**
• Rising demand for sustainable transport. • Growth in semi-urban and rural markets. • Advances in battery technology. • Expansion of charging infrastructure. • Potential for exports and local manufacturing.	• Intense competition among manufacturers. • Changes in subsidies and policy. • Volatile battery-material prices. • Concerns about safety and durability. • Competition from petrol two-wheelers.

SWOT interpretation: the industry benefits from consumer interest, innovation and a growing manufacturer ecosystem. Long-term success depends on affordability, charging access, battery reliability and customer service. Policy changes and competitive pressure also require careful management.

8. Future Opportunities and Recommendations

Suggested Strategic Priorities (Qualitative Scale 1–5)



The priority scores are an illustrative assessment to support discussion, not measured survey results.

Recommended actions:

1. Invest in research and development to improve battery performance, reliability and safety.

2. Expand convenient charging options in residential areas, workplaces, commercial centres and highways.

3. Offer products at different price points for commuters, families and business users.

4. Strengthen after-sales support, warranty transparency, spare-parts availability and service coverage.

5. Develop responsible battery collection, reuse and recycling systems.

9. Conclusion

The Indian electric two-wheeler industry is an important part of the country's evolving mobility ecosystem. Growing interest in economical transportation, technological improvements, wider product choice and policy support have helped the market develop. Companies such as TVS Motor, Bajaj Auto, Ather Energy, Ola Electric and Hero MotoCorp contribute to competition and innovation.

Challenges involving battery costs, charging infrastructure, customer confidence, supply chains and after-sales service remain. Manufacturers that combine affordability with safety, dependable performance, convenient charging and strong customer support will be better positioned for sustainable growth.
